## 1 - A client send a message to one of the servers of the client

The client send with a UDP protocol or a websocket ; so the server a no information about the message and the message itself is crypted with a AES256 key.
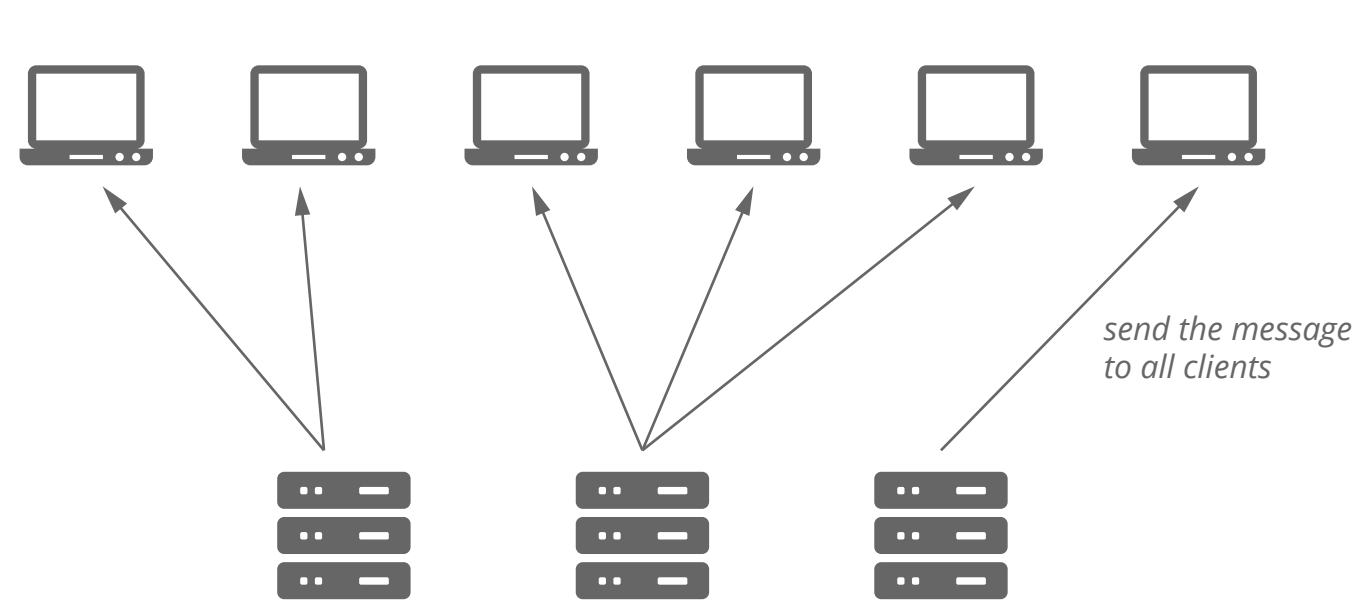

Clients

Servers

encrypted message
with no readable
meta data

connections

2 - The server propagates the message to the other servers of the cluster

send the message

3 - The servers send the message to theirs clients

So everyone gets all the datas

send the message
to all clients

4 - The client process the message with his keys

*If the client can decrypt the message with the keys he has,
he keeps it and displays it otherwise, he ignores the message.*
